Insight

ERP Software

Manufacturing ERP systems are data hubs that enable digital mapping of business processes. ERP software is vital to implement Industry 4.0 in furniture and woodworking production. While classic ERP solutions focus on general economic challenges, industry-specific ERP systems tackle the unique requirements of the industry and manage them as standard business processes.

For over 20 years, we have developed and implemented 2020 Insight globally as a manufacturing ERP system for the woodworking industry. 2020 Insight delivers a complete ERP solution for manufacturing that manages day-to-day processes from the opportunity through order, production and installation. The robust technology and flexible architecture of 2020 Insight's ERP system allows cabinet, furniture and architectural millwork manufacturers and distributors to configure a unique solution to meet their business requirements and succeed in the marketplace.

Highlights

- End-to-end solution for the digitization of all daily business processes
- Integrated Manufacturing Execution System (MES) solution
- Integrated Warehouse Management System (WMS) solution
- Integrated CAD/CAM solution
- Integrated materials and supply chain management
- World-class product configuration and engineering tools
- Integrated project management solution
- Integrated optimization and CNC technology
- Integrated customer service and installation solution
- Powerful business intelligence
- Interfaces with industry point-of-sale order processing solutions, financial solutions and customer relationship solutions
- Modular and scalable
- Multilingual

ERP Functional Areas

Workflow and business automation
Reduce complexity with our powerful workflow engine that enforces your unique business processes, triggers automatic actions, notifies users and enriches data for down-the-line processes.

Estimating and order management
Eliminate duplication of work and improve customer satisfaction with accurate information and real-time status updates from order to delivery.

Engineering automation
Innovate product offering and accelerate time to market with on-demand creation of standard and custom products.

Product & process management
Improve business processes by configuring your products and their flow through production using flexible product data tools.

Material & supply chain management
Reduce costs and eliminate delays with integrated purchasing, inventory and material requirement planning (MRP) functionality.

Production planning
Plan resources and schedule production and shipments to match your manufacuturing processes.

Shop floor execution
Manage and optimize your production and react quickly with browser-based shop floor control functionality that communicates in realtime from anywhere at any time.

Machine integration
Reduce costs and synchronize production by connecting your machines directly to gain best overall performance and yield.

Optimization management
Increase your productivity by optimizing materials, labor and machine capacity.

Warehouse management
Speed fulfillment and increase efficiency by managing inventory, sales and production information across regions, between your plants and with your partners.

Service installation management
Improve communication and customer satisfaction by managing installation and service activities at your customer's site with real-time communication.

Project management
Increase efficiency and reduce administrative tasks by automating and managing your projects from start to finish.

Business intelligence
Make better business decisions by turning your data into actionable intelligence to be viewed anytime from anywhere.

Integrations
Optimize your manufacturing data by connecting it to your finance, customer relationship management and other business support systems.

Manufacturing cost accounting
Control your labor, material and overhead costs with data-driven knowledge from an integrated solution.

Asset management
Track and manage your machines and plan maintenance so you get the most out of your production.
